## GREENS REQUIRE SPECIAL CARE IN THE SPRING

Superintendents realize players are anxious to begin play in early spring. They also know when it is safe to open play. Eager players may say, “looks good to me, the surface appears lush and green.” What some do not realize, ice may still exist under the fairway or green. In icy conditions, foot and cart traffic breaks or kills plant cells-like cracking an eggshell. The same occurs in frost conditions. Carts may create longer lasting damage slowing healthy turf growth and making more work for maintenance.

Decisions to create temporary greens in the spring are determined by many variables-one being turf winterkill. Special care besides normal maintenance may require closing a primary green to eliminate foot and ball mark damage. Green repair relies heavily on Mother Nature. Be patient if an alternative green is established. Temporary greens are commonly ruled ground under repair-no play zone. Take free relief and know the maximum posting score is Par Plus. THANK YOU for obeying closure/delay signs and for staying “Outside the Ropes!”
